**DETAILED ACTION**

***Election/Restrictions***

1. Applicant's election without traverse of Group I, Claims 1-5 in the reply filed on 10/6/2006 is acknowledged.

***Claim Rejections - 35 USC § 102***

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

3. Claims 1-5 are rejected under 35 U.S.C. 102(e) as being anticipated by Lewis et al. (US Patent 7053125).

Lewis teaches comb polymers which are used as dispersant to increase the stability of colloidal suspensions containing multivalent or high concentrations of

monovalent ions. The colloidal suspensions are also disclosed (Abstract). The suspension includes a carrier liquid which can include a variety of organic solvents such as alcohols, DMF, DMSO, acetone, THF, glycerol or ethylene glycol (Column 5, lines 28-37). Particles that could be dispersed in the carrier fluid include metal particles such as copper (Column 5, line 61-63) and particle sizes can range from 1 nanometer to 100 microns (Column 9, lines 4-8). The comb polymer itself can have a backbone that includes "cationic polyelectrolytes" (Column 10, lines 3-6). Examples of these polyelectrolytes include poly(2-dimethylaminoethyl methacrylate) (Column 10, line 49). The side chains of the comb polymer are formed from "capping agents" that include polyethylene oxide or polyethylene glycol (Column 11, lines 17-19). Lewis also suggests that such colloidal suspensions find widespread use in various applications including colloid based inks (Column 1, line 18).
